```
New hypersensitive response eliciting (dspE) gene and protein useful for providing transgenic plants and seeds with enhanced growth, and insect and disease resistance
Claim 1; Page 37-38; 56pp; English.
```

This the DNA sequence of the dspE gene of Pseudomonas syringae pv tomato DC3000 that codes for a 42.9 kDa hypersensitive response celicitor (HRE) polypeptide (see AAW97851), termed HrpW. To identify any HRE-like genes in the P. syringae pv. tomato DS3000 DNA flanking hrpR, cosmid pCPP2357, which contains this region in vector pCPP47, was isolated. A series of subclones in pML123 were constructed and Screened for 2 potential HR phenotypes: (1) the ability to promote tobacco HRE activity in Pseudomonas fluorescens cells carrying pCPP274, a delhrp2 pHT711 derivative, and (ii) interference with CC pCPP2774, a delhrp2 pHT711 derivative, and (ii) interference with CC pCPP2774, a delhrp2 pHT711 derivative, and (ii) interference with CC pCPP2774, a delhrp2 pHT711 derivative, and (ii) interference with CC pCPP2773, had the first phenotype, but one, pCPP2373, had the CC second. Transcriptional unit v of this subclone contained the CC second. Transcriptional unit v of this subclone contained the CC second. Transcriptional unit v of this subclone contained the CC second. Transcriptional unit v of this subclone contained the CC second. Transcriptional unit v of this subclone contained the CC second. Transcriptional unit v of this subclone contained the CC second. Transcriptional unit v of this protein or contained DNA molecule can be used to impart disease resistance to CC plants. This is achieved by applying the HRE protein in a CC con-infectious form to plants or plant seeds. Alternatively, CC transgenic plants or plant seeds. Alternatively, CC transgenic plants or plant seeds transformed with DNA encoding the CC contained the CC contained transcriptional seeds transformed with DNA encoding the CC contained the CC contained transcriptional contained transcriptional contained transcriptions.

                                                                                                                                                                                                   The patent discloses a method to impart stress resistance to plants applying a hypersensitive response elicitor in a non-infectious form a plant or seed. The present sequence is dspE gene encoding hypersensitive response elicitor protein from Pseudomonas syringae. The present sequence is used to transform transgenic plant or plant seeds to impart stress resistance.

Instead, the proteins impart disease resistance to plants, enhance plant growth, and/or control insects. The polypeptide fragments may be used to these properties to plants. The plants which may be treated in this way include vegetables, crops and ornamental plants such as alfalia, rice, wheat, barley, rye, cotton, sunflower, peanut, corn, potato, sweet potato, bean, pea, chicory, lettuce, endive, cabbage, brussel sprout, beet, parsnip, turnip, cauliflower, broccoli, radish, spinach, onion, garlic, eggplant, peper, melon, citrus, strawberry, grape, raspberry, pineapple, soybean, tobacco, tomato, sorghum or sugarcane, Arabidopsis thaliana, Saintpaulia, petunia, pelargonium, poinsettia, chrysanthemum, carnation or zinnia.

The hypersensitive response is rapid localised necrosis. The hrp protein and gene when used in nucleotide constructs are useful for providing disease resistance plants, insect control to plants, and enhancing plant growth (enhancing fruit size and earlier colouration and maturation), by direct application of the protein to plants, or by producing transgenic plants or seeds using the hrp gene.
                                                                                                                                                                                  1199

Instead, the proteins impart disease resistance to plants, enhance plant growth, and/or control insects. The polypeptide fragments may be used to these properties to plants. The plants which may be treated in this way include vegetables, crops and ornamental plants such as alfalfa, rice, wheat, barley, rye, cotton, sunflower, peanut, corn, potato, sweet potato, bean, pea, chicory, lettuce, endive, cabbage, brussel sprout, beet, parsnip, turnip, cauliflower, broccoii, radish, spinach, onion, garlic, egyplant, pepper, califlower, citrus, strawberry, grape, raspberry, pineapple, soybean, tobacco, tomato, sorghum or sugarcane, Arabidopsis thaliana, Saintpaulia, petunia, pelargonium, poinsettia, chrysanthemum, carnation or zinnia.

KSM-P15. The pectic acid lyase has high pectic acid lyase activity which degrades pectin in plant cell walls and fibre in vegetables, and so is useful as a component of detergents, a food-processing agent, or a fibre-processing agent. The pectic acid lyase has a higher optimum reaction pH (10.3-10.7) than known Bacillus pectic acid lyases (pH 8-9.5) and so has wider industrial applications. Unlike present pectic acid lyases, the new enzyme has a high enzyme
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1154

                                                                                                                                                                    This sequence represents a gene encoding a subunit of the cellulose synthates complex of Vigna angularis. The invention relates to subunits cellulose synthetic equipment, that can be used to increase the amount cellulose synthesised by a plant. The proteins and genes encoding them can also be used to improve the properties of the cellulose being produced by a plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1511

                                                                                                                                                                                                                                                                                                                 The sequence is that of an example randomising oligonucleotide which is used in the prepn. of mRNA encoding candidate polypeptides for the method of systematic polypeptide evolution by reverse translation (SPERT). The method provides a rapid way of isolating and identifying polypeptide ligands which bind to target mols. The polypeptide ligands can be used in e.g. assay methods, diagnostic procedures, cell sorting, as activators or inhibitors of target mol function, as probes, as sequestering agents, drug delivery vehicles, modififers of hormone action and as catalysts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   닭
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁
                                                                                                                              SPERT is used to select novel polypeptides that bind the antibody of the epitope commonly recognised by the antisera from autoimmune mice which are the fl progeny of a cross of NZB and NZW parents (Portanova et al., J. Immunol. 144, 4633, 1990). The known epitope consists of ca. 10 amino acids at the N-terminus of the histone H2B protein. To make mRNA encoding candidate polypeptides a 5' fixed sequence composed of a T7 promoter sequence and a ribosome binding site which is recognised by both prokaryotic and eukaryotic ribosomes.
                          terminating in a restriction endonuclease site is synthesised and cloned using a number of oligonucleotides (example shown). A 3' fixed sequence is placed into a restriction site to provide an mRNA encoding the C-terminal trailer sequence of ca. 100 nucleotides lacking stop codons. In addition, a 3' primer annealing site is provided so that cDNA synthesis can be accomplished on the mRNA recovered from partitioned ribosome complexes. See also AAQ36845-63.

01-AUG-1991;
                 The present sequence was used in an example illustrating an invention relating to a method for isolating a polypeptide ligand for a desired target molecule. The method involves synthesising a nucleic acid mixture comprising mRNA having translatable and non-translatable regions and a mixture of nucleic acid polypeptide copolymers, each comprising the mRNA and a cold polypeptide copolymers.
                                                                                                                                                                                                                                                                                                                                                                                                                                        (PRIB/)

The method is termed systemic polypeptide evolution by reverse translation (SPERT). The polypeptides ligands of small molecule targets are useful in assay methods, diagnostic procedures, cell sorting, as inhibitors of target molecule function, as probes, as drug delivery vehicles and modifiers of hormone action and have therapeutic uses as sequestering agents. The target molecules include natural and synthetic polymers, including proteins, hormones, receptors and cell surfaces, nucleic acids and small molecules such as drugs, metabolites, cofactors and toxins. Polypeptide ligands are isolated and rapidly identified by this method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1256

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   a protopectinase having an optimum pH 7 or higher against protopectin and polygalacturonic acid substrates. Inclusion of protopectinase gives a composition that provides better removal of muddy soil, particularly from socks. The present sequence encodes pectic acid lyase from Bacillus sp. strain KSM-P15, which is used in an example from

                                                                                                                        Q
                                                                                                                                                                                                                               The present sequence is a DNA encoding pectate lyase I. It is a pectin degrading enzyme derived from Bacillus licheniformis, ATCC 14580. The enzyme comprises a catalytic active domain and a cellulose binding domain (CBD) that are operably linked to each other. It shows optimum activity at pH greater than 9 and temperature 55 degree centigrade. It can be used in detergent compositions, for cleaning hard surfaces, for machine treatment of fabrics, for improving the properties of cellulosic fibres, yarn, woven or non-woven fabric, for the degradation of plant material e.g. recycled waste paper, mechanical paper-making pulps or fibres subjected to retting process, for preparing animal feed and for processing wine or juice. DNA encoding the enzyme can also be used for the production of transgenic plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pectate lyase I; EC 4.2.2; pectin degrading enzyme; ATCC 14580; catalytic activity; pH; detergent composition; yarn; cellulosic fibre; recycled waste paper; pulp; retting process; animal feed; wine; juice;

                                                                                                                                                                                                                                                                This sequence encodes an immunogenic portion of a soluble Mycobacterium tuberculosis (MT) antigen which can be used in a method for inducing protective immunity against tuberculosis (TB). This sequence can be formulated into vaccines and/or pharmaceutical compositions for immunising against M. tuberculosis infection or may be used for the diagnosis of tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1330

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Score
